# QUALITY CONTROL

## Go paperless and reduce time consuming administration

The MARCO Trac-IT® Quality Control Module enables quality control operators to access and share necessary information at the click of a button.

**100% digital - 0% paper**
Specifically developed to enable businesses to digitise quality control procedures across all areas of manufacturing and production, MARCO's improved QCM enables Quality Control Operators to easily capture and share essential information at the click of a button.
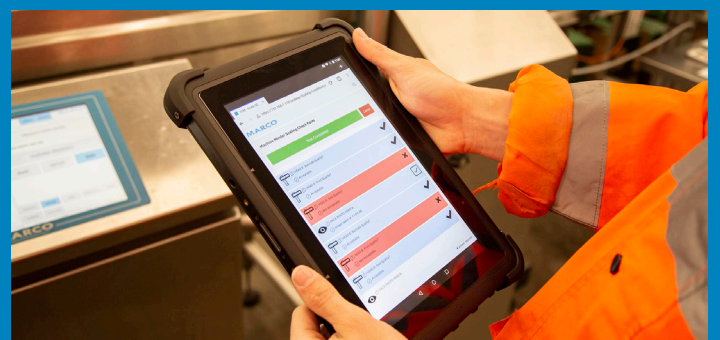

QCM enables structured quality checks with a configurable scoring system, each answer is recorded against the individual or aspect of the business in accordance to pre-set targets. This allows you to quickly identify any areas needing improvement, ranging from common machine faults to pack presentation.

QCM utilises MARCO's QC Master, a IP65 rated ruggedised tablet/PC suitable for all types of working environments. Supervisors log onto QCM via a unique pin or RFID tag in order to view the relevant questionnaires alongside a colour coded countdown to completion deadline.

The QC Master comes with high definition camera for capturing detailed pictures for you to upload to a secure server demonstrating a job has been completed or highlighting an area of concern. Scanning a barcode will automatically populate the relevant questionnaire to the unique station, eliminating human error in selecting the correct personnel.

**No more paper!** QCM will store all information on the MARCO server, enabling you to access all recorded data instantly. Using administrator configured settings, reports can be automatically saved or emailed to the relevant person or file location.
