

PACKING EXCELLENCE

MARCO are known throughout the world for providing the very best technology solutions for manufacturing and packing operations, using unique software and hardware.

MARCO design, manufacture, install and maintain every system they produce. This means that you only have to deal with one company and that they have absolute control over quality, delivery times and performance.

With MARCO's design excellence, state-of-the-art technology and attention to detail, no matter what the size of your business you can count on improved yields, reduced waste and greater profitability.

In manual packing operations there is a fine balance to be struck between speed and accuracy. The first problem is that individual fruits and vegetables vary in size and weight. Too much in a pack affects profits and costs more to transport. Too little and you may breach pack weight legislations.

Therefore, consistently packed produce is a must for retailers. So, effective Yield Control - consistency and accuracy, combined with high levels of productivity is vital to your business.

MARCO Trac-IT Yield Control Module gives you comprehensive, real time data enabling you to measure and control the packing process minute-by-minute throughout the working day.

Each operator has a unique ID login to ensure each packer is individually monitored. The simple-to use traffic light system guides operators as the meals are assembled, ensuring individual component target weights are kept within very close tolerances.

Key recorded factory floor data includes:

- Operator accountability via approved ID logon
- Number of weighings completed over time/per operator
- Total quantity of input ingredients allocated to any particular line
- Actual amount used at each workstation/line
- Weighing trends by operator/line
- Rapid access to electronic traceability
- Yield data by batch run/total production
