Full goods intake control for all raw materials

Key features of GRM

- Goods intake control
- Barcode scanning & label printing
- Increased reporting
- Raw material traceability

Benefits of GRM

- Quickly adapt to changing market conditions
- Increased management insight
- Eradicate intake losses/waste
- Speed up the intake & inventory process
- Increased traceability

The **MARCO Trac-IT® Goods Received Module (GRM)** has been designed for businesses working in all industries, specifically fresh produce, food manufacturing, flavours & fragrances, pharmaceuticals, healthcare and cosmetics.

It is designed to provide full traceability of raw material coming into the facility from goods intake to packaging.

With this increased traceability you optimise and connect your whole operation and increase your management insight.

MARCO's Goods Received Module provides full goods intake control with all raw material coming from suppliers being recorded using the label printing and barcode scanner capabilities.

Pallets, containers and punnets of raw material are all tracked through the Goods Received Module and assigned

MARCO TRAC•IT® Goods Received Module

storage locations to give complete management oversight of the handling of all raw materials in your facility.

All deliveries received by your facility can be entered into the module as either planned or unplanned deliveries and then assigned a purchase order number using your pre-approved list of suppliers to pay for exactly what comes into your business, avoiding overpaying for product not received.

MARCO's Goods Received Module integrates with MARCO applications to provide additional optimisation for your facility and full traceability of raw material that can assigned to a production line and returned to storage when needed.
